

School-home join — Presenter PRD

Print \$6 and keep it visible. If a banned phrase is spoken, stop and correct. Athena’s confidential PDF is the specification; anything else is “idea, not roadmap.”

Version 0.1 | 25 August 2026

Status: **Draft for mixed-room presentation** (technical partner, grant/investor, school / TSC / county officer).

Companion critique: *ATHENA_EDUCLOUD_DEVILS_ADVOCATE.md*.

Demo script: *SCHOOL_HOME_JOIN_DEMO_SCRIPT.md*.

This document does **not** replace *HOME_STUDY_COMPANION_V2_PRODUCT_PLAN.md* or *MVP_LAUNCH_CHECKLIST.md*. It defines the join story and the week-one prototype only.

1. One line

Athena Learn is the USB classroom practice system for Junior Secondary. EduCloud is the phone/home revision companion. They meet through a homework pack, not through cameras.

2. Problem (what the mixed room already believes)

Rural peak pupil–teacher ratios make individual attention mathematically scarce (Athena cites MoE Basic Education Statistical Booklet 2022/23 sub-county tables; rural peaks around 1:60). Roughly 30% of Kenyan schools have reliable internet (Communications Authority of Kenya, Q4 2023/24). After class, revision happens on shared phones and, where they exist, school-lab PCs — not on a second copy of the classroom roster in the cloud.

The missing loop is **the same skill practised tonight**, not a camera that guesses who looks bored.

3. Product split (do not blur)

Surface	Owner	Who	Device	What is true today	What is not true today
School	Athena Learn (Spidey Labs)	Teacher + learners in class	Classroom Windows PC / “smart board” PC, USB install	Practice banks; local teacher analytics ; Kuriot JSS onboarding partner	Teacher assignment ; lesson-plan generator; facial analysis; live join to EduCloud
Home / revision	EduCloud (this repo)	Learner (caregiver optional later)	Android phone; later PWA / lab PC	Grade 3 Maths tutor, quiz, habit shell, “Explain it my way”	Grade 6–9 banks; classroom roster; KICD-approved content
Bridge	Contract (prototype here)	Token, not a child	JSON pack + class code	Week-one labelled prototype	Shared database, names, photos, video

EduCloud decisions D9 (Athena as partner, not dependency) and D17 (no teacher copilot inside EduCloud) stand, with **one thin exception**: this prototype emits and consumes a homework pack. EduCloud does not become a school information system.

4. Architecture

```
Athena classroom PC (local SQLite, named roster stays here)
|
| export HomeworkPack (skill_id, item_ids, class_code — no names, no faces)
v
class code -----> EduCloud Android (pseudonymous UUID)
^
| optional attempt events (item_id, correct, learner_token UUID)
|
Teacher Sidekick prototype (Django, this repo, labelled "not Athena production")
```

Pack fields (v1): `schema_version`, `assignment_id`, `skill_id`, `item_ids`, `issued_at`, `class_code`.

Forbidden in the pack and in the pitch: names, emails, photos, national IDs, GPS, emotion scores, face embeddings, “brain” or trait labels.

Smart board: the classroom Windows PC that already drives the board. No Promethean/SMART SDK in this PRD.

5. Non-goals (v1 and this room)

- Computer vision, classroom cameras, “engagement heatmaps,” sleeping/bored detectors.
 - TRIBE, fMRI, phantom brain, IQ/EQ, diagnosis, ranking, streaming, punishment.
 - A live binary integration of Athena’s monorepo and EduCloud.
 - Grade 7 content inside EduCloud, or Grade 3 presented as JSS.
 - KICD/KEC “approved curriculum content” claims.
 - Offline frontier AI on government DLP tablets.
 - Zeraki-style fees, exams, report cards, or a second SIS.
 - Full KICD-format lesson-plan generation as the lead feature.
 - AI verdicts on lesson quality, teacher “engagingness,” or any per-teacher score, export, or coaching output.
 - Assign-as-test with AI marking of open responses; anything auto-marked entering a CBC continuous-assessment record.
 - Per-pupil re-theming of **scored** items (themed explanations and worked examples only).
 - Child chat transcripts or “subchats” pushed, looped, or made visible to the school side.
 - Adult-facing learning-habit or trait claims about a named pupil.
 - A live in-lesson teacher chatbot.
 - Night-lab sessions that use, link, or create a home pseudonymous account on school hardware.
 - Vendor smart-board SDKs or “runs on the panel” hardware claims.
-

6. Do-not-say list (slide 0 — keep visible)

Print this. If a word below is spoken, stop and correct.

Two reviews exist. The second pass — *SCHOOL_HOME_JOIN_GRILL.md*, 26 Aug 2026, 6 Critical / 4 Major — is harder and is **authoritative wherever it differs from the first pass**. §5 and §6 reflect it.

Three specifications exist; only one counts. Athena’s confidential PDF is the specification. The public site overstates it and the verbal pitch exceeds both. Anything not in the PDF is said as “idea, not roadmap” — or not said.

- Facial recognition, computer vision, cameras, “we can see who is sleeping.”
 - Brain, TRIBE, phantom brain, neural, “the AI reads their mind.”
 - “KICD-approved” / “official curriculum content.”
 - “Already used in N schools” beyond **Kuriot JSS as an onboarding partner.**
 - “Works fully offline including the AI tutor on every government tablet.”
 - “We diagnose who is lazy / not engaging.”
 - “One app, all grades, live today.”
 - “Athena already assigns homework to phones.”
 - “EduCloud is the smart-board OS.”
 - “The AI tells the teacher how the lesson went” / “we score teaching quality” / “we coach the teacher.”
- Highest-severity item in the room: TSC/TPAD appraisal capture and KNUT/KUPPET exposure. Do not wander near it.**
- “Assign it as a test and the AI marks it against the teacher’s rules.” Auto-marked work can reach Grade 9 placement through CBC continuous assessment, and the liability lands on the teacher.
 - “We tweak the test to each student’s interest.” Two themed items are two different measurements. Themed **explanations** are fine; themed **scored items** are not.
 - “Subchats / the child’s tutor chat get looped to the school side.” No moderation, no safeguarding escalation, no named responsible adult exists.
 - “Integrates with smart boards” unqualified. Many panels run embedded Android and cannot host the Tauri/Windows/SQLite build without an OPS module. Say: *the classroom Windows laptop that drives the display.*

“Deterministic” — one word, two meanings. Check which one you are about to say.

Applied to...	Verdict
a child — “we deterministically know where this student’s problem is”	BANNED. It is a wide-interval BKT estimate, and Athena’s <code>practice_results</code> cannot compute it today (no <code>question_id</code> , <code>strand</code> , <code>difficulty</code>). Say “estimated, from N recent attempts,” with “not enough evidence” as a real answer.
a system fallback — the rule-based content path with no LLM in it	PERMITTED. “Deterministic fallback” stays legal; see below.

What you may say

- USB install onto existing classroom laptops; practice works without internet.
- Athena’s in-repo inventory (disclose that the public site currently lists four JSS areas while the PRD counts six — see the devil’s advocate table).
- Teacher dashboard today = **analytics**, not direction.
- EduCloud can re-explain a **verified Grade 3** lesson through a declared interest chip, with deterministic fallback (rule-based, no LLM in the path — the permitted sense above).
- The join is a **contract we are prototyping**. Athena teacher-direction is **unbuilt** (their PRD §6).
- Predicted struggle, when it exists later, comes from **practice attempts**, not faces.

- **If library / night-lab access is raised, state the condition in the same breath:** lab sessions run the school's local install under **school identity only** — no home pseudonymous account used, linked, or created there — and a **written after-hours policy from the school** (supervising adult, parental permission, incident log, lighting and transport, closing time) is a precondition before the mode is enabled. Without it, the mode stays off.

7. Eight-to-ten minute deck

Min	Beat	Proof in the room
0:00	Slide 0: do-not-say list	Paper or first slide
0:45	Problem: 1:60, ~30% reliable internet, revision happens at home	Athena prospectus stats with sources
2:00	Two surfaces: school USB vs home phone	Architecture diagram above
3:30	Optional Beat 0: Athena desktop practice + read-only dashboard	Only if Peter brings the USB/app — do not fake it in EduCloud
5:00	Live home loop: Tonight from class → Grade 3 regrouping quiz → Explain it my way	This repo
7:00	Teacher Sidekick prototype: assign <code>G3-HOME</code> , aggregate item misses	Browser at <code>/demo/teacher/sidekick</code>
8:30	What is not built (direction on Athena, cameras, live join, KICD)	Honest list
9:30	Ask: cofounder alignment or grant next step or remaining pilot slot — one ask only	

8. Week-one demo — acceptance

A presenter can complete this loop without lying.

1. Banner on the teacher page is visible: *Contract prototype. Not Athena production. Not facial analysis.*
2. Assign tonight's revision for skill `two_digit_subtraction_regrouping`; class code `G3-HOME` is shown.
3. Android **Tonight from class** accepts that code **or** the bundled fixture and opens the existing Grade 3 maths quiz (and the tutor with a regrouping prompt).
4. Teacher page can show aggregate "n learners attempted, n missed item X" from **item results** (live POST or the page's demo-attempt button). No names, no faces.
5. Backend and Android unit tests for pack validation (unknown skill, oversized body, forbidden PII keys) pass.

Out of week one: Athena monorepo edits, smart-board SDKs, OpenCV, live BKT, lesson-plan LLM, Kiswahili banks, Grade 7 in EduCloud, real child data.

9. Security rules for the "secure system"

- School roster never syncs to EduCloud.
- Home never stores the child's school name.

- Learner tokens on the bridge are UUIDs, not aliases.
 - Purpose limitation: homework completion on a named skill, nothing else.
 - Cloud sync and re-explain remain consent-gated and disabled-by-default unless a demo opts in.
 - Any future camera, microphone-for-the-class, or trait model requires a separate DPIA, Kenyan counsel, and an ethics review — they are **not** on the roadmap in this PRD.
-

10. Open questions this document does not pretend to close

1. Written commercial/data-governance terms with Athena Learn (EduCloud D9 / risk R7).
2. Whether Athena Phase B (teacher direction) lands before any real pack is emitted from *their* SQLite.
3. KICD confirmation (`info@kicd.ac.ke` in Athena's risk register).
4. Aligning athenalearn.org with PRD Part I before a school-officer audience.
